

G Succulents GUIDE...

Planting:

- Choose a container with a drainage hole in the bottom
- Prepare your container by lining the bottom with a layer of pea gravel
- Add well-draining soil such as cactus soil or potting soil combined with sand
- Remove the succulent from its pot or tray and nestle into the soil of your container
- Maintain soil level (i.e. plant shouldn't be buried too low in the soil or raised high above the soil)
- Top the soil with a layer of gravel

Light and Temperature:

- Succulents require at least a half day of sunlight. The more light, the better!
- Many succulents are not cold hardy to our region. Anytime the outdoor temperature is below 50°F, bring your planter indoors.
- Succulents like Hens & Chicks and Sedum are cold hardy to zones 3-5. They can overwinter outdoors.

Watering:

- After planting, water thoroughly. Do not allow water to pool on the leaves.
- Thereafter, only water when the soil is dry (i.e. push your finger into the soil to your first knuckle. If your finger-tip feels dry, then you can water). Succulents do not like wet feet.
- the stem and dis-card.. The plant will fill in with new leaves.
- If your succulents out-grow your planter, or stretch due to insufficient light, simply trim them back with scissors or pruners.

FOUR LOCATIONS TO SERVE YOU!

BREMEC
Garden Centers
12265 Chillicothe Road
Chesterland
440 - 729 - 2122
